THE BUCKWHEAT PLANT
The buckwheat plant grows to about one meter high.

The white flowers are at the ends of bunched stems.

Leaves are shaped like triangles.

Fruits are shaped like little pyramids.

GROWING BUCKWHEAT
Plant in the spring or fall. Sprinkle about 1 tablespoon of seeds per square meter. Rake in and water.

In two weeks, buckwheat will make a dense cover over the soil. I’ll cut it when it flowers. It will rot quickly and add lots of organic matter to the soil.
USES
Buckwheat is a multipurpose crop. It makes a good cover crop, because it smothers weeds very well. You can feed it to animals. You can roast the fruit to make kasha, or grind it to make flour.
