Carrot Family

APIACEAE (OR UMBELLIFERAE)
The name Umbelliferae comes from the Latin word meaning "umbrellas." Plants in the carrot family have flowers that look like little umbrellas.

DID YOU KNOW?
Some members of the carrot family, such as wild parsnip and giant hogweed, can burn your skin. With the help of ultraviolet light from the sun, chemicals found in the green leaves, stems, and fruits of these plants can break down skin tissue, make the skin red, and cause blisters.

Maybe you touched wild parsnip or giant hogweed a day or so ago. Your skin will stop hurting soon, but it may stay discolored for a while.

Look at my skin! These blisters hurt!
MEMBERS OF THE CARROT FAMILY

There are more than 3,000 species in the carrot family. (Click on a plant for more information.)

Some have strong unique flavors and smells, and are used as herbs and spices.

Many have roots, stems, or leaves that are used as vegetables. Some contain nutrients, such as beta carotene, that are important in the human diet.

Others are poisonous.
